Functions not working correctly:
- 1. Responsive Design
  - Action that causes failure: Resizing the browser window
  - Failure: The design is not responsive. The artwork and elements on the website become incorrectly positioned as the browser window is resized.
- 2. Clipboard Icon
  - Action that causes failure: Clicking on the clipboard icon
  - Failure: The website link is not displayed for copying and sharing when the clipboard icon in the navbar is clicked.
- 3. Share Buttons
  - Action that causes failure: Running on a non 16:9 display
  - Failure: The share buttons (twitter, facebook, and copy link) are not in-line with the text in the navbar.
- 4. Navbar Layer
  - Action that causes failure: scrolling to a position where the navbar intersects with another interactable element (including the about page text) or scrolling to a position in between pages
  - Failure: Due to its position in App.js, the navbar will appear underneath other interactable elements. This is both visually unappealing and can make these elements unresponsive to mouse input. Scrolling to a position that is in between pages also makes the navigation bar elements non-interactive even if there are no elements overlapping with the navbar.
